REQUIREMENT GATHERING

Date: 11-12-2025

1. **Project Overview**:

   AgileFlow is an intelligent project and sprint management system designed to simplify agile workflows through automation, real-time visibility, and role-based collaboration. It solves key challenges in existing tools, such as manual status updates, complex interfaces, and lack of smart task assignment. The main objective is to streamline project tracking, improve team productivity, and deliver automated insights for better sprint execution.

2. **System Scope**:

   The system is developed as a **working prototype** with near–real-world functionality. It includes essential agile features such as sprint creation, issue management, workload heatmaps, automation engine, and notifications. While not a full enterprise-level product, it demonstrates core functionalities needed for real-time agile workflow management.

3. **Target Audience**:

   - Software development teams
   - Scrum Masters & Project Managers
   - Students and academic research teams
   - Organizations adopting agile methodology
   - Individuals needing structured project tracking

4. **Modules**:

   - **User & Role Management** – Authentication, authorization, role-based access.
   - **Project Management Module** – Project creation, team allocation, settings.
   - **Board & Workflow Module** – Kanban/Scrum board setup, columns, workflow tracking.
   - **Sprint Management Module** – Sprint creation, deadlines, sprint backlog, velocity tracking.
   - **Issue/Task Management** – Task creation, assignment, prioritization, subtasks, comments.
   - **Automation Engine** – Auto-assign tasks, auto-update statuses, detect delays.

- **Notification Module** – In-app and email notifications for task updates.

- **Reports & Insight Dashboard** – Bottleneck detection, workload heatmaps, activity logs.

5. **User Roles**:

Admin

- Full access; manages users, projects, system configurations.

Scrum Master / Project Manager

- Creates sprints, manages workflow, oversees team progress, views reports.

Developer / Team Member

- Works on tasks, updates progress, adds comments, collaborates with team.

Viewer / Stakeholder

- Read-only access to dashboards and project progress.

6. **System Ownership**:

The system is owned by the **academic institution** and developed by the student (project developer) as part of an academic project submission. Future enhancements may allow use by organizations or project teams.

7. **Industry/Domain**:

Software Development / Project Management / IT Services
AgileFlow specifically aligns with the agile methodology domain and workflow management tools.

8. **Data Collection Contacts**:

Name: Savio Jose
Role: Full Stack Developer
Organization: Leopard Tech Labs
Contact Details: +91 75599 16094

9. **Questionnaire for Data Collection**:

- **Which project management tool do you currently use (e.g., Jira, Trello, Asana)?**

The project lead mentioned that their company does not currently use any dedicated project management software such as Jira or Trello. Instead, they rely on a standard industry-practiced workflow model. Their process focuses on clearly defining roles, assigning responsibilities based on the depth and complexity of functionalities, and managing coordination through established team-based practices. This traditional, people-centric workflow allows them to maintain clarity in task division, accountability, and progress tracking without the use of digital tools.

- **What difficulties do you commonly face while tracking tasks or issues?**

The project lead said that the main difficulty they face is that task estimations often change as the project progresses. A task initially assigned to one person may later require two or three people once the real complexity becomes clear. This causes delays and re-allocation issues. They follow an Agile workflow to handle this, but sometimes changing requirements still create challenges.

- **How often do you face delays due to outdated task statuses or missed updates?**

The project lead mentioned that delays due to outdated task statuses or missed updates happen fairly often. Since they don't use a dedicated project management tool, task progress is usually communicated verbally or through basic methods. This sometimes leads to outdated information, overlooked updates, and confusion about who is currently handling what. As a result, minor miscommunications can grow into delays, especially when multiple people need to collaborate on the same task.

- **Do you feel the current tool is too complex or overwhelming for new users? Why?**

The project lead mentioned that since they do not use any dedicated project management tool, the issue of complexity doesn't arise. However, he noted that when companies rely on traditional, people-based methods, new team members can sometimes feel overwhelmed because there is no centralized system to view tasks, updates, or responsibilities. Without a structured tool, newcomers must rely heavily on verbal instructions and manual coordination, which can make the onboarding process more confusing.

- **How helpful would automated task assignment be in reducing workload imbalance?**

The project lead said that automated task assignment would be highly helpful in reducing workload imbalance. Since tasks often change in complexity during development, manual assignment sometimes leads to one person handling more work than others. An automated system that distributes tasks based on skill, availability, or current workload would make the process more balanced, reduce delays, and improve overall team efficiency.

- **Do you prefer manual status updates, or would you benefit from auto-updating workflows linked to commits?**

The project lead mentioned that while manual status updates are their current practice, an auto-updating workflow—especially one linked to commits or team activity—would be far more beneficial. Manual updates are often delayed or missed, which leads to outdated task information. Automated updates would provide real-time clarity on progress, reduce communication gaps, and ensure that the entire team stays aligned without relying on constant manual input.

- **Which features do you use the most—boards, sprints, reports, or notifications?**

The project lead mentioned that among the commonly used features in project management systems—such as boards, reports, and notifications—he relies most heavily on sprint-based workflows, particularly the sprint threshold method. This approach helps him monitor progress within each sprint, identify when tasks exceed expected effort or time, and make necessary adjustments to keep the team aligned with project goals. Sprint thresholds act as checkpoints that help manage scope changes and maintain overall project stability.

- **What additional insights or analytics would help you during sprint planning?**

The project lead said that having more detailed insights during sprint planning would greatly improve accuracy and workload distribution. In particular, he would benefit from analytics showing individual team capacity, historical velocity trends, estimated vs. actual effort, and tasks that frequently exceed their sprint thresholds. These insights would help him plan sprints more realistically, anticipate bottlenecks, and assign work more effectively.

- **Would a workload heatmap help in understanding team capacity more effectively?**

The project lead agreed that a workload heatmap would be very helpful for understanding team capacity. He mentioned that having a visual representation makes it much easier to see how efficiently the team is performing and how the project is progressing. Such visuals help highlight workload distribution, identify over- or under-utilized team members, and maintain a clearer overview of overall efficiency.

- **What improvements would you suggest for a new agile project tracking system?**

The project lead suggested that a new agile tracking system should focus on better automation, clearer visual dashboards, and real-time workload insights. He emphasized keeping the interface simple and easy to update so the team can track progress without confusion or extra effort.
